

Customer and Product Portfolio Overview

ช่วงข้อมูล: — สร้างเมื่อ: 2026-07-16 10:59

This report provides a concise overview of the total number of customers and products currently recorded in our systems. As of the latest data retrieval, the organization serves 122 customers and manages a portfolio of 110 distinct products. These figures are crucial for understanding the scale of our operations and for strategic planning.

Total Customers

122

Total Products

110

Summary of Key Entities

Entity Type	Total Count
Customers	122
Products	110

Key Business Metrics

The total count of 122 customers indicates a solid customer base that drives our business operations. Concurrently, the 110 products in our catalog represent the breadth of our offerings and our capacity to meet diverse market demands. These numbers are foundational for various business functions, including sales forecasting, inventory management, and customer relationship management strategies.

Technical Data Sourcing and Validation for IT Support

For the IT support team, understanding the origin and validation of these metrics is paramount. The data for this report was derived directly from the core database tables: 'customers' and 'products'. Specifically, the total customer count was obtained by executing `COUNT(customernumber)` on the 'customers' table, where 'customernumber' serves as the unique primary key identifier for each customer record. Similarly, the total product count was calculated using `COUNT(productcode)` on the 'products' table, with 'productcode' being the unique identifier for each product. This approach ensures that each distinct customer and product is counted exactly once, preventing duplicates and providing an accurate representation of our current operational scale. The SQL query used was `SELECT (SELECT COUNT(customernumber) FROM customers) AS total_customers, (SELECT COUNT(productcode) FROM products) AS total_products;`. This method leverages subqueries to efficiently retrieve both counts in a single database transaction. For ongoing system health and data integrity checks, IT support should monitor the consistency of these counts, especially after data migrations, system updates, or bulk data operations. Discrepancies could indicate issues with data entry, unique constraint violations, or problems within the database schema itself. Regular validation of these fundamental counts is a critical aspect of maintaining a reliable and accurate data environment for business intelligence and operational reporting.
